Mixing Qualitative and Quantitative... for social simulation?

- Lorentz workshop
- Relevant questions:
  - What is actually done?
  - How is it done?

A review of practises would be handy right?!

Let's get an impression here: How do you (envision) mix?

Do you mix Qual and Quant (methods, data, theory)?

Yes

No

What is mixed in your research?

Data

Theory

Method

Other

What methods do you use?

What does mixing means for you?

Integrating (using different types of data/theory/method for the same thing (a particular variables, a particular stage etc)

Combing (using different types of data/theory/method for different things (variables, stages e.g. one source of evidence for design, one for validation)

Mixing - Order in which method/data/theory are used

First qual then quant

First Quant then Qual

Zig-zag

Parallel

Other

In what modelling stage is what evidence used?

design

building (coding, calibrate, parametrise...)

testing (verification & validation)

Other

What is next

- Fill out the actual survey: https://forms.gle/JBjp3jceKaAkYuPk9

- We will post it on simsoc soon, …

- We will present our intermediate results and work on a paper during a workshop in Manchester (Nov)

Thanks for your participation!
Any feedback or questions?
